

Case Study: Railing Estimation & Pricing System

Challenge

Estimation for complex railing projects lacked accuracy and consistency. There were significant gaps in labor-hour calculations and material costing, and the old method relied on multipliers without clear standards—creating risks of underquoting or overquoting.

Action

- Collaborated with purchasing, supply chain, and production teams to collect reliable data.
- Conducted **time studies** for each process to establish realistic labor hours.
- Built advanced Excel-based **material costing sheets** with updated prices and consumption rates.
- Integrated labor and material sheets into a unified framework for consistency.
- Enabled estimators to **re-run quotes** with detailed, standardized logic.

Result

- Delivered a **standardized, transparent, and faster** estimation process.
- Quotes became more **accurate and competitive**, reducing financial risk.
- Estimators prepared detailed proposals more quickly than before.
- Improved cross-functional alignment—purchasing, production, and estimation teams worked from the same cost data.
